April 2016

Dear Colleagues:

We are pleased to release the *2013 Sexually Transmitted Disease Clinic Morbidity Report* for Los Angeles County (LAC). This report summarizes demographics and morbidity data on chlamydia, gonorrhea, syphilis, and HIV for clients served in the twelve Sexually Transmitted Disease (STD) clinics operated by the LAC Department of Public Health in 2013. The first section of the report includes summary data for all 12 clinics followed by separate sections for each individual STD clinic.

The following are data highlights associated with this report:

Demographics

- In 2013, there were 35,260 visits at the twelve STD clinics in LAC – 21,980 (62.3%) of which were new visits, and 13,280 (37.7%) were return visits. (Table 1.1)
- Sixty-six percent of patients were male, 34% were female, and 0.3% were transgender or unspecified. Twenty five percent of patients were under 25 years old, 37% were between 25 and 34 years old, 32% were 35-54 years old, and 6% were over 54. Thirty-eight percent were African American, 35% were Latino, 18% were White, 5% were Asian, and 3.6% classified themselves as other. (Table 1.1)
- Men who have sex with women accounted for a majority of visits (47.2%), followed by women who have sex with men (29%). Men who have sex with men, including men who have sex with both men and women (MSM/W), accounted for 14.1% of patients, and women who have sex with women and men (WSW/M), plus women who have sex with women (WSW), accounted for 1.8% of patients. (Table 1.1)

Trends in Demographics

- Total visits to the STD clinics in LAC have declined from 45,589 in 2009 to 35,260 in 2013, a decrease of nearly 23%. (Table 1.1b)
- Visits to the STD clinics among persons aged 15-19 and 20-24 years old have both decreased steadily every year, from 4,153 and 10,406 respectively in 2009 to 1,975 and 6,818 respectively in 2013. (Table 1.1b)
- From 2011 to 2013, proportions of visits by MSM/W have steadily increased from 13.0% to 14.1%, whereas proportions of visits by WSW have decreased from 49.4% to 47.2% at the same period. (Table 1.1b)

Disease Morbidity by Risk Group

- Fifty percent of female patients and forty-six percent of male patients reported their reason for coming to the clinic was due to symptoms being present. (Figure 1.3&1.4)
- Of the 22,894 patients tested for STDs in the clinics, chlamydia was the most commonly diagnosed STD, with a 9.8% positivity rate, among all patients, followed by 6.2% positivity rate for gonorrhea, 5.8% for syphilis, 1.0% for early syphilis, and 0.7% for HIV. (Table 1.2)
- Among males visiting the STD clinics in LAC, the highest positivity rates for chlamydia and gonorrhea were found among 15 to 24 year olds, the highest positivity rate for early syphilis was found among 55 to 64 year olds, and the highest positivity rate for HIV was found among those over 64 years old. (Table 1.4)
- Among females visiting the STD clinics in LAC, the highest positivity rates for chlamydia and gonorrhea were found among adolescents and young adults 24 years or younger, the highest positivity rate for early syphilis was found among women 45 to 54 year olds, and the highest positivity rate for HIV was found among 30 to 34 year old and 45 to 54 year old women. (Table 1.4)
- Transgender patients had a chlamydia positivity rate of 19%, gonorrhea positivity rate of 18%, early syphilis positivity rate of 9.6%, and an HIV positivity rate of 7.7%. Due to low numbers of transgender patients, breakdowns by age group are not reported. (Table 1.3)
- Among males visiting public STD clinics in LAC, African Americans and Latinos had disproportionate rates of all STDs. African Americans had the highest positivity rates for chlamydia and gonorrhea, and Latinos had the highest positivity rates for early syphilis and HIV. Among females visiting the STD clinics in LAC, Asians had the highest positivity rate for chlamydia, African Americans had the highest positivity rates for gonorrhea and HIV, and Latinos had the highest positivity rate for early syphilis. (Table 1.5)

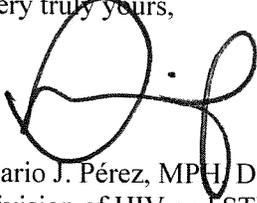

Trends in Disease Morbidity in STD Clinics

- Positivity rates for chlamydia steadily decreased from 11.3% in 2009 to 9.6% in 2012, before slightly increasing to 9.8% in 2013. (Figure 1.11a)
- Positivity rates for gonorrhea were stable between 4.5% and 4.7% from 2009 to 2011, and have subsequently increased yearly up to a high of 6.2% in 2013. (Figure 1.11a)
- Positivity rates for early syphilis remained low, between 0.4% and 0.6% from 2009 and 2012, but rose dramatically to 1.0% in 2013. (Figure 1.11b)
- Positivity rates for HIV have remained stable, between the 0.6% and 0.8% range, (Figure 1.11b) but have dramatically increased at Wittier Health Center to 1.9% in 2013. (Figure 1.19)
- Chlamydia, gonorrhea, and early syphilis positivity rates are increasing among MSM/W (Figure 1.12, 1.13, 1.14). HIV positivity rates among MSM and MSM/W seen in the STD clinics have declined since 2009 from 6.0% to a relatively flat 4.0%. (Figure 1.15)
- Among the 137 HIV-positive testers, 24 had chlamydia and HIV co-infection, 30 had gonorrhea and HIV co-infection and 15 had early syphilis and HIV co-infection, meaning that over half (50.3%) of all HIV-positive testers were co-infected with an STD. (Table 1.6)

Los Angeles County Department of Public Health
Division of HIV and STD Programs
2013 STD Clinic Morbidity Report
April 2016

We hope that this report serves as a resource to better understand STD morbidity in our public clinics, and as a guide to focus critical STD and HIV casefinding efforts throughout Los Angeles County.

Very truly yours,

Mario J. Pérez, MPH, Director
Division of HIV and STD Programs

Sonali Kulkarni, MD, MPH, Medical Director
Division of HIV and STD Programs

Susie Baldwin, MD, MPH, Associate Medical Director, STD Controller
Division of HIV and STD Programs

The *Sexually Transmitted Disease Clinic Morbidity Report* is published by the Los Angeles County Department of Public Health's Division of HIV and STD Programs. This report is also available in PDF format at <http://publichealth.lacounty.gov/dhsp>.

*Screening plus confirmatory test

[†]Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

^{††}Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

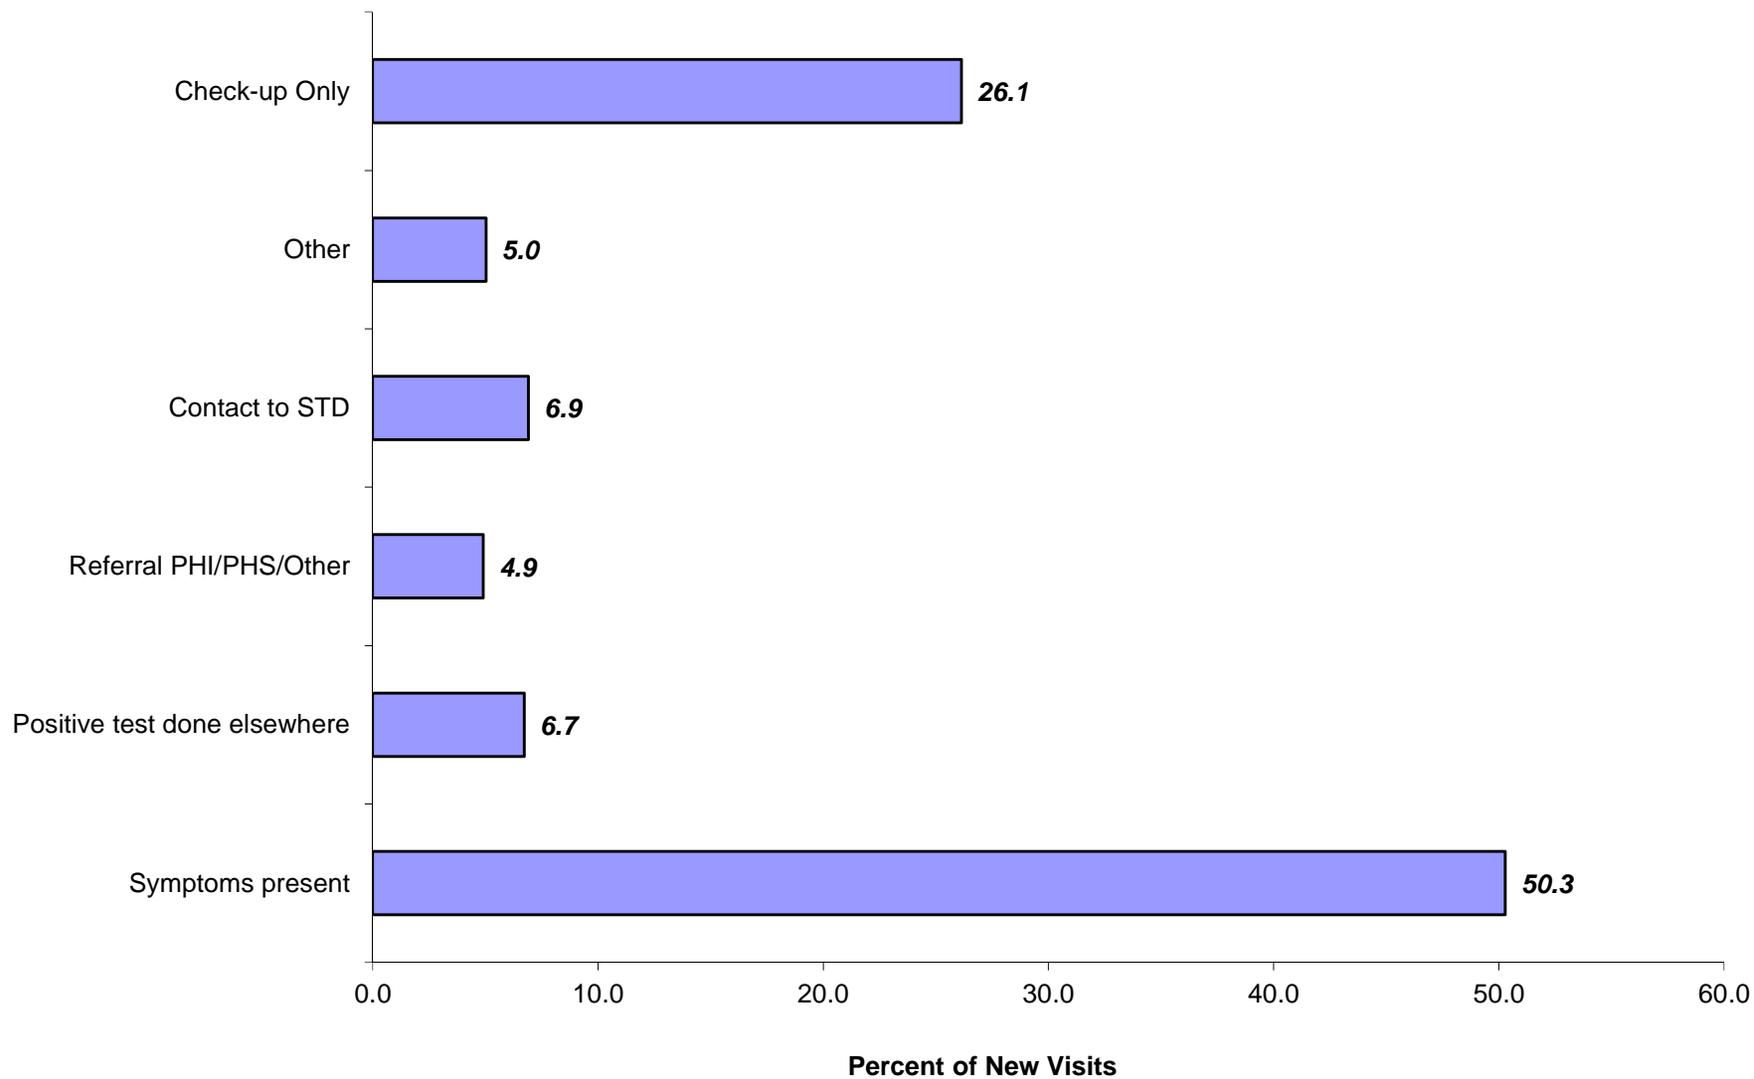

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

¹Positive for both chlamydia and HIV on the same visit; ²Positive for both gonorrhea and HIV on the same visit; ³Positive for both confirmed early syphilis and HIV on the same visit

*Percentage of HIV cases

†Transgender includes cases of male-to-female (MTF), female-to-male (FTM), unspecified, and unknown.

††Based on self-reported gender of sexual partners; "MSM/W" = men who have sex with men, and men who have sex with men and women; "MSW" = men who have sex with women; "WSM" = women who have sex with men; "WSW/M" = women who have sex with women, and women who have sex with men and women

Note: "Visits with HIV Test" refers to number of individual visits and not individual tests (ie. a patient who is tested with an HIV EIA and Western Blot on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

*Screening plus confirmatory test

†Transgender includes male-to-female (MTF), female-to-male (FTM), and unspecified, as well as unknown.

††Based on self-reported gender of sexual partners; "MSM/W"=men who have sex with men, and men who have sex with men and women; "MSW"=men who have sex with women; "WSM"=women who have sex with men; "WSW/M"=women who have sex with women, and women who have sex with men and women

Note: "Visits Tested" for chlamydia, gonorrhea, syphilis and HIV refers to number of individual visits and not individual tests (ie. a patient who is tested for urethral and rectal chlamydia on the same visit is only counted as one visit tested)

Section XIV:

Appendices

APPENDIX A: LABORATORY DIAGNOSTIC TESTS USED FOR THE DIAGNOSIS OF SEXUALLY TRANSMITTED DISEASES IN LAC STD CLINICS

All specimens sent from the Los Angeles County STD Clinics for gonorrhea, chlamydia, syphilis, and HIV were tested at the Department of Public Health, Public Health Laboratory. Cervical cytology specimens were tested by the Laboratory Corporation of America (LabCorp) and Foundation Laboratories.

Testing for *Neisseria gonorrhoeae* and *Chlamydia trachomatis*

Chlamydia trachomatis and *Neisseria gonorrhoeae* were detected from urine, vaginal, and endocervical swabs using a nucleic acid amplification test (NAAT) Aptima Combo 2 Assay (Gen-Probe, Inc., San Diego, CA). This same test technology was validated by the Public Health Laboratory to test for chlamydia and gonorrhea in rectal specimens and gonorrhea in pharyngeal specimens. In this report, urogenital testing refers to any urine, urethral, cervical or vaginal specimens.

Testing for syphilis

Blood was screened for syphilis using the Rapid Plasma Reagin (RPR) test which is a nontreponemal assay. The RPR antigen detects reagin, a nonspecific antibody present in the serum of persons with syphilis. Positive RPR tests were followed by the treponemal, confirmatory Treponema pallidum-particle agglutination (TP-PA) assay. The TP-PA detects *Treponema pallidum* antibodies in the serum as an aid in the diagnosis of syphilis and provides useful epidemiological information.

Testing for HIV

Until March 2008, blood was screened for antibody to HIV-1 using a first generation enzyme-linked immunosorbent assay (ELISA), Vironostika HIV-1 Microelisa System (Organon Teknika). In March 2008 the laboratory changed to use a more sensitive third generation test ADVIA Centaur XP, (Siemens Medical Solutions Diagnostics, East Walpole, MA). This is a chemiluminescent assay for HIV 1&2 plus GpO. Positive sera were confirmed using a Western Blot test (Genetic Systems Bio-Rad Laboratories).

APPENDIX B: DATA MANAGEMENT

Data Management Methods

With the exception of Antelope Valley Health Center visits, the Public Health Information System (PHIS) was used to examine all visits classified as “STD Clinical Visits.” The information collected from PHIS included demographic information such as gender, age, and race/ethnicity. Specific visit information such as clinic visited, date of visit, and visit classification (i.e., “New” or “Return” visit) was also obtained from PHIS. The Quadramed System provided the demographic and visit information for Antelope Valley Health Center.

Additional information on gender of sex partners and HIV testing history was obtained from the H2541 Intake Forms. The H2541 Intake Form is interviewer-administered to patients at new visits (see below for “new visit” definition) and collects more extensive demographic, behavioral risks, std history, and treatment information.

Sexual orientation of patients was based on the self-reported gender of sex partners from the H2541 Intake Form, which recorded the gender of sex partner(s) for the following two time frames: past 12 months and past 3 months. All available H2541 Intake Forms for each particular patient dating back to 2006 was used for information on gender of sex partners. If a patient had previously only reported no sex partners or refused to report the gender of sex partners on the H2541 form(s), then the sexual orientation for that patient was listed as “unknown”.

SUNQUEST, the Public Health Laboratory database system was used to obtain laboratory results for chlamydia, gonorrhea, syphilis, and HIV. The laboratory results were merged with the PHIS/Quadramed data using the medical record number and the date of clinic visit/specimen collection. In addition, a definitive syphilis diagnosis for those with a positive confirmatory syphilis test was obtained from STD*CASEWATCH. “New HIV” status for patients testing HIV positive was based on previous HIV testing information from all available SUNQUEST, STD*CASEWATCH, and H2541 Intake Form data. If there was no record of a previous positive HIV test in any of these data archives, then the HIV positive patient was designated as a “new HIV” case. The final dataset contains one record for each patient, per visit to the STD clinic (ie. individual visit). The “individual visit” is the unit of observation used in all tables and figures and referred to as such.

Data Limitations

Possibility of multiple visits: If a patient sought care for the same event at multiple clinics, each visit was captured as a separate visit.

Definition of new visits: In order to account for multiple return visits for the same event, analyses were conducted examining only visits classified as “New Visits.” The Department of Health Services’ “Procedures for Completing the Clinic Data/Patient Encounter Form” (Policy No. 301) specifies that:

- A “New Visit” is one in which a person is seeking service for the first time, or for a new episode, in an established clinic in the facility. Examples include a first time visit to a STD clinic; or a visit for a new episode, if the patient was previously treated adequately.
- A “Return Visit” is one in which a patient has a follow-up visit to a clinic or ancillary service in the facility for further evaluation, treatment, or results.

Clinic sessions: A clinic session is a half-day when the STD clinic is open. The number of sessions held varies by STD clinic from 2 sessions a week to 9 sessions a week.

STD CLINIC REGISTRATION SCHEDULE

July 2013

Please note, all schedules are subject to change. Patients should be advised to call the STD clinic to confirm that a particular session is being held. Patients are seen on a first come, first served (walk-in) basis, except Whittier clinic by appointment only. It is advisable for patients to arrive as early as possible to improve the likelihood of being seen. No fees are charged for services in the Los Angeles County Department of Public Health STD clinics.
