January 14, 2010

Dear Colleague,

I am pleased to release the *2008 Sexually Transmitted Disease (STD) Clinic Morbidity Report for Los Angeles County*. This report summarizes chlamydia, gonorrhea, early syphilis, HIV and herpes testing and morbidity from Los Angeles County Department of Public Health's twelve STD clinics: Antelope Valley, Simms Mann Health & Wellness Center (formerly Yvonne Burke), Central, Hollywood-Wilshire, Monrovia, North Hollywood, Pomona, South, Ruth Temple, Torrance, Curtis Tucker, and Whittier Health Centers.

In 2008, these public health centers had near 46,000 STD related visits and tested over 29,000 patients for chlamydia, gonorrhea, syphilis, and/or HIV. Chlamydia was the most commonly diagnosed STD (11.3%), followed by gonorrhea (4.6%), HIV (0.8%) and early syphilis (0.5%).

The report presents the summary section for all health centers first, followed by sections of each of twelve health centers. Other sections included in the report are: chlamydia and gonorrhea testing and morbidity by anatomic site, HIV and STD co-diagnoses, and herpes simplex virus morbidity by gender.

We hope that this report serves a resource in designing population-specific STD prevention and intervention programs for those seeking care at the Los Angeles County Department of Public Health STD clinics.

Sincerely,

Peter R. Kerndt, M.D., M.P.H.

*There was two tests with unknown gender, and one was positive for HSV1

Sexually Transmitted Disease Clinic Morbidity Report, 2008

XVII: Appendices

APPENDIX A: LABORATORY DIAGNOSTIC TESTS USED FOR THE DIAGNOSIS OF SEXUALLY TRANSMITTED DISEASES IN LAC STD CLINICS IN 2008

All specimens sent from the Los Angeles County STD Clinics for gonorrhea, chlamydia, syphilis, herpes, and HIV were tested at the Department of Public Health, Public Health Laboratory.

Testing for *Neisseria gonorrhoeae* and *Chlamydia trachomatis*

Chlamydia trachomatis and *Neisseria gonorrhoeae* were detected from urine, endocervical, and rectal swabs using a nucleic acid amplification test (NAAT) Aptima Combo 2 Assay (Gen-Probe, Inc., San Diego, CA). The same test was also used to detect *Neisseria gonorrhoeae* from pharyngeal swabs.

Testing for syphilis

Blood was screened for syphilis using the Rapid Plasma Reagin (RPR) test which is a nontreponemal assay. The RPR antigen detects reagin, a nonspecific antibody present in the serum of persons with syphilis. Positive RPR tests were followed by the treponemal, confirmatory Treponema pallidum-particle agglutination (TP-PA) assay. The TP-PA detects *Treponema pallidum* antibodies in the serum as an aid in the diagnosis of syphilis and provides useful epidemiological information.

Testing for HIV

Until March 2008, blood was screened for antibody to HIV-1 using a first generation enzyme-linked immunosorbent assay (ELISA), Vironostika HIV-1 Microelisa System (Organon Teknika). In March 2008 the laboratory changed to use a more sensitive third generation test ADVIA Centaur XP, (Siemens Medical Solutions Diagnostics, East Walpole, MA). This is a chemiluminescent assay for HIV 1&2 plus GpO. Positive sera were confirmed using a Western Blot test (Genetic Systems Bio-Rad Laboratories).

Testing for Herpes

Lesions/specimens were tested for Herpes Simplex Virus using real time polymerase chain reaction (PCR) (Real Art HSV ½ Light Cycler, Roche Diagnostics) that has been validated by the Public Health Laboratory for performance and/or conventional virus culture methods.

APPENDIX B: DATA MANAGEMENT

Data Management Methods

The Public Health Information System (PHIS) was used to examine all visits classified as “STD Clinical Visits.” The information collected from PHIS included demographic information such as gender, age, race/ethnicity, and marital status. In addition, PHIS information was used to determine the clinic visited as well as specific visit information such as the date of visit, tests conducted, and visit classification (i.e., “New” or “Return” visit). In addition, data from Quadramed was used for Antelope Valley Health Center because it does not use PHIS.

MISYS, the Public Health Laboratory database system was used to obtain laboratory results for chlamydia, gonorrhea, syphilis, and HIV. The laboratory results were merged with the PHIS/Quadramed data using the medical record number and the date of clinic visit/specimen collection. In addition, a definitive syphilis diagnosis for those with a positive confirmatory syphilis test, as well as treatment information for chlamydia, gonorrhea, and syphilis, was obtained using STD*CASEWATCH. The final dataset contains one record for each patient, per visit to the STD clinic.

Data Limitations

Possibility of multiple visits: If a patient sought care for the same event at multiple clinics, each visit was captured as a separate visit.

Definition of new visits: In order to account for multiple return visits for the same event, a separate analysis was conducted examining only visits classified as “New Visits.” The Department of Health Services’ “Procedures for Completing the Clinic Data/Patient Encounter Form” (Policy No. 301) specifies that:

- A “New Visit” is one in which a person is seeking service for the first time, or for a new episode, in an established clinic in the facility. Examples include a first time visit to a STD clinic; or a visit for a new episode, if the patient was previously treated adequately.
- A “Return Visit” is one in which a patient has a follow-up visit to a clinic or ancillary service in the facility for further evaluation, treatment, or results.
